## M1-SOAC TD3 <br> Chapter 3: Geophysical Waves

## Question a:

The yellow sea (between Korea and China) is at $37^{\circ} \mathrm{N}$. Its average depth is 50 m and its perimeter is 2600 km .
$\rightarrow$ How long does it take for a coastal Kelvin wave to do one circuit of the basin?

## Question b:

A barotropic Rossby wave crosses the Pacific at $20^{\circ} \mathrm{N}$. Its wavelength is 1000 km (we consider the mean current to be zero).

1) How long does it take to cross the basin?
2) And how long for a wave at 50 N. ?

The Pacific spans $140^{\circ}$ of longitude at $20^{\circ} \mathrm{N}$ and $80^{\circ}$ of longitude at $50^{\circ} \mathrm{N}$.
The radius of the Earth is 6400 km .
